

Double the difference

Tube duo with a slim and an angled actuator for 2-phase treatments

Quadpack | A rather different tube now on the market is the **Double Tube** from Quadpack: it consists of two tubes that are closed in the centre with one single cap. Unlike other double tubes on the market this new model is made up of two separate parts that can be filled on standard filling machines. The tube is supplied as standard with a slim actuator and also an angled actuator. It is thus suitable for two-phase treatments, such as a combination of anti-ageing serum and an intensive moisturiser. It allows for the joint packaging of special treatments and cosmetic products, such as cream for acne or spots together with a concealer, or lip balm and colour gloss. The advantage to consumers of keeping a single product in their handbag is clear.

The tube is available in 5 ml and 10 ml sizes for both sides and can be designed and decorated in a wide variety of styles from the simplest colour scheme to a detailed and elegant pattern. It is made from polypropylene and polyethylene, and is 100 percent recyclable.
