

Quadpack's heated mascara is a two-part applicator designed to achieve sleek, long lashes. One part is a professional mascara brush, the other a special heating wand that smoothes away lumps, shapes the lashes and maximises volume.

The brush has an ergonomic angle of 27° for maximum ease of use and a more intuitive application. A heat-resistant mascara is first applied to both sides of the lashes. Two coats will achieve a more voluminous effect, especially when allowing the mascara to dry fully between coats. A special mini-tip at the end of the brush makes it easy to cover the lower lashes.

Melting the mascara for even coverage

The heating wand then gently 'melts' the mascara and redistributes it evenly, for a totally smooth coverage. The colour is drawn to the outer edges of the lashes, making them appear longer and fuller.

The wand can be used to shape eyelashes much in the same way as a hair iron. The temperature of the mascara wand, however, is so mild that it can be held against the fingers when heated. The patented system is designed to maintain a controlled temperature of between 65 and 70°C.

The heating wand switches off automatically after three minutes or on replacing the cap,

to make sure the battery does not drain when the wand is not in use.

The mascara applicator does not have to be thrown out once the mascara formulation has been used up, as mascara refills are available. AM
